DETAILED ACTION

Allowable Subject Matter

Claims 1-6, 8 & 12-13 are allowed [renumbered as 1-9].

The following is a statement of reasons for the indication of allowable subject matter:

There is no prior art that shows the claimed tire-information administration system comprising: a plurality of sensor modules installed in tires; at least one reception module configured to receive data from the sensor modules; and a central control module configured to command the reception module to acquire data from the sensor modules;

wherein said central control module comprises: a predetermined number of connection ports for the reception module, assigned in advance to each sensor module; and control means configured to: sequentially output at a predetermined sampling time a command of data acquisition from a first sensor module, to a first connection port assigned to the first sensor module; assign the first connection port to the first sensor module for a next sampling, when there is a data input from the first sensor module in response to the command; and assign the command of data acquisition from the first sensor module to a second connection port different from the first connection port, and assign the second connection port to the first sensor module for the next sampling,

when there is no data input from the first sensor module even by the command issuance in claim 1: and

claim 7 recites tire-information administration system comprising: a plurality of sensor modules mounted in tires, respectively; a reception module configured to receive data from the sensor modules; and a central control module configured to command the reception module to acquire data from the sensor modules; wherein the reception module comprises: a plurality of antennas each arranged near any one of tires and configured to transmit and receive signals to and from each of the sensor modules; a single reception body portion connected to the antennas via wirings; and antenna switching means for electrically connecting and disconnecting between the reception body portion and each antenna; wherein the reception body portion is provided with control means for modulating a command signal from the central control module to thereby generate an output signal to a first antenna, and for demodulating a signal from the first antenna to thereby output data to the central control module; wherein a first sensor module is previously assigned to the first antenna, respectively; and wherein said central control module is configured to conduct procedures for:

sequentially outputting at a predetermined sampling time a command of data acquisition from the first sensor module, to the first antenna assigned to the first sensor module; assigning the first antenna to the first sensor module for a next sampling, when there is a data input from the first sensor module in response to the command; and
